Research Interest

My research covers software engineering, artificial intelligence, and LLMs for code, with the goal of modernizing and enhancing the reliability of large-scale software systems. To this end, I leverage program analysis and LLMs to automatically translate and validate repository-level code across different programming languages. So far, my work has focused on evaluating LLMs in code translation and investigating translation bugs [C5], source code decomposition for code translation [C4], and building end-to-end neuro-symbolic repository-level code translation [C3] and validation [P1] tools.

Beside code translation, I have also enjoyed working on other problems in software engineering [C2, C6] and machine learning for bioinformatics [J7, J8].
