Research Interest

My research covers software engineering, machine learning, artificial intelligence, LLM agents, LLMs for code, and formal reasoning with the goal of modernizing and enhancing the reliability of large-scale software systems. To this end, I leverage program analysis and LLMs to automatically translate and validate repository-level code across different programming languages. So far, my work has focused on evaluating LLMs in code translation and investigating translation bugs [C4], source code decomposition for code translation [C3], and building end-to-end neuro-symbolic repository-level code translation [C2] and validation [P1] tools.

Beside code translation, I have also enjoyed working on other problems in software engineering [C1, C5] and machine learning for bioinformatics [J1, J2].
